

The Secret of Captain Code and the Sparkling App

Chapter 1: The Code-Cave and the Big Mission

Once upon a time, in a cozy office called the **Code-Cave**, lived a superhero named **Captain Code** (her secret identity was Anya). Her big mission was to build a brand-new toy shop website called "**Sparkle Shop**." She had a super-tight deadline: the grand opening was planned for **October 25th**!

Captain Code knew the first rule of building: you must use the right tools! She needed a special instruction manual, **React version 18.2.0**, which was very strict about how toys' prices updated. She wrote this important number down in her giant project book, on **Page 2**.

Chapter 2: The Treasure Chest and the Magic Memo

To keep track of all the inventory—the dolls, the cars, and the tiny robots—Captain Code opened a special "**Treasure Chest**" (the Context API) inside a folder called `/src/context/`. She used a magical little trick called the **useReducer** hook to help the Treasure Chest keep count.

But the Toy Gallery was very fussy! It didn't want to re-draw all the pictures unless a specific key, the **galleryID**, changed. So, Captain Code put a special, sleepy blanket around it called **React.memo**. This blanket made the gallery skip drawing unless the **galleryID** prop was different!

One day, a sneaky bug appeared! Every time someone put toys in their cart, the total sometimes flashed **\$0.00**. This major mess was hiding on **Page 5** of the project book.
